EXP NO: 4 DEVELOP A SIMPLE CALCULATOR USING XMLRPC

AIM:

To develop a simple calculator using XMLRPC

4

server.py - C:/Users/REC/AppData/Local/Programs/Python/Python31...

```
import socket

# Four functions for four operations
def addition(a, b):
    return a + b

def subtraction(a, b):
    return a - b

def multiplication(a, b):
    return a * b

def division(a, b):
    if b == 0:
        return "Cannot divide by zero"
    return a / b

# Create socket
server = socket.socket(socket.AF_INET, socket.SOCK_STREAM)

# Bind server to IP and port
server.bind(("localhost", 5000))

# Listen for client
server.listen(1)

print("Server is waiting for client...")

# Accept connection
conn, addr = server.accept()

print("Client connected:", addr)

# Receive data from client
data = conn.recv(1024).decode()

# Data format: number1,number2,operator
num1, num2, operator = data.split(",")

num1 = float(num1)
num2 = float(num2)

# Perform operation
if operator == "+":
    result = addition(num1, num2)

elif operator == "-":
    result = subtraction(num1, num2)

elif operator == "*":
    result = multiplication(num1, num2)
```

Ln: 67 Col: 14

client.py - C:/Users/REC/AppData/Local/Programs/Python/Python311...

```
import socket

# Get input from user
num1 = input("Enter first number: ")
num2 = input("Enter second number: ")

print("\nChoose operation:")
print("+ : Addition")
print("- : Subtraction")
print("* : Multiplication")
print("/ : Division")

operator = input("Enter operator: ")

# Create socket
client = socket.socket(socket.AF_INET, socket.SOCK_STREAM)

# Connect to server
client.connect(("localhost", 5000))

# Send data to server
data = num1 + "," + num2 + "," + operator
client.send(data.encode())

# Receive result from server
result = client.recv(1024).decode()

# Display result
print("\nResult received from server:", result)

# Close connection
client.close()
```

Ln: 32 Col: 14

RESULT:

Thus the simple calculator has been developed using XMLRPC
